

COOLDOWN

Burn out while you code. Keep momentum when you rest.

A local, private, and ultra-light cognitive load tracker for developers — stop burnout before it hits with a real-time Fatigue Score.

Tauri + Rust

OVERVIEW

Ever found yourself saying "one more commit" after hours of debugging? Cooldown quietly watches stress signals while you work — build errors, failed terminal commands, context switches, typing cadence — and turns them into a **Fatigue Score** from 0 to 100.

It integrates with VS Code, Cursor, PowerShell, and Zsh, storing everything locally in SQLite — never in the cloud. Built on Tauri, it runs in the background, lives in your system tray, and nudges you to take breaks when you need them.

The result: a more sustainable coding rhythm, more intentional breaks, and less silent burnout.

HOW IT WORKS

01 IDE & Terminal Hooks — The VS Code / Cursor extension sends build, lint, and test errors; PowerShell and Zsh hooks report failed commands silently to 127.0.0.1:9876.

02 Rust Backend Analysis — Window switches, keyboard tempo, and error events are combined into a live Fatigue Score. OS-level, event-driven window tracking keeps CPU and RAM usage minimal.

03 Local SQLite Storage — Metrics, journal entries, and your personal baseline stay on your device. No cloud, no telemetry, no third-party APIs.

04 React Dashboard — Cognitive Map, Screen Time, trend reports, and smart break notifications in one interface. The tray icon shows your status with color.

● **FLOW**

0 - 40

● **DISTRACTION**

40 - 75

● **BURNOUT**

75 - 100

KEY FEATURES

Live Fatigue Score

Dynamic 0–100 score from context switches, error density, and typing tempo. Updates in near real time.

IDE & Terminal Integration

VS Code, Cursor, PowerShell, and Zsh hooks automatically capture build errors and failed commands.

Local-first Privacy

Data stays on your machine. Sensitive window filtering and automatic protection for banking and password managers.

Smart Break Reminders

Graduated alerts (60/75/90), smart snooze, contextual break suggestions, and micro-journal to make breaks meaningful.

Cognitive Map & Deep Work

Daily cognitive load chart, deep work score, weekly/monthly trends, and personal baseline comparison.

Screen Time Analysis

Categorizes time across IDEs, browsers, and communication apps — see where your focus actually goes.

Focus Mode

25/50-minute focus sessions; suppresses non-critical alerts and only warns on true burnout signals.

Tray + Mini Widget

Color-coded tray icon (green/yellow/red), draggable mini widget, silent background operation.

DEVELOPER-FRIENDLY DETAILS

- ▶ Error categorization: build, lint, test, runtime, terminal
- ▶ Anomaly detection & proactive break suggestions (14-day baseline)
- ▶ Plugin registry — vscode, terminal, powershell source tracking
- ▶ Micro-journal archive: "What was I working on before this break?"
- ▶ Benchmark mode: self-monitoring for memory, CPU, and uptime (~80–130 MB RAM)
- ▶ Dark / soft light theme, data retention policy (30–365 days)
- ▶ Screen lock detection on Windows and macOS for accurate break tracking

Why Cooldown?

Sustainable coding isn't just about fast commits — it's about listening to your body and mind. Cooldown is a silent co-pilot for the moments developers are most vulnerable: endless debug loops, consecutive CI failures, and evenings lost to "just one more tab."

Less burnout. Smarter breaks. Better code.
